

■ Types of Functions in JavaScript

1■■■ **Function Declaration (Normal Function)**

- Also called named function
- Can be called before it is defined (hoisting)

```

```
function add(a, b) {
```

```
 return a + b;
```

```
}
```

```

2■■■ **Function Expression**

- Function stored inside a variable
- Cannot be called before it is defined

```

```
const add = function(a, b) {
```

```
 return a + b;
```

```
};
```

```

3■■■ **Arrow Function (ES6)**

- Short syntax
- Does NOT have its own this

```

```
const add = (a, b) => a + b;
```

```

4■■■ **Anonymous Function**

- Function without a name

- Mostly used in callbacks

```

```
setTimeout(function() {
 console.log("Hello");
}, 1000)
```
```

5■■■ **Callback Function**

```

```
function greet(cb) {
 cb();
}

greet(() => console.log("Hi!"));
```
```

6■■■ **IIFE (Immediately Invoked Function Expression)**

```

```
(function() {

 console.log("I run instantly!");
})();
```
```

7■■■ **Async Function**

```

```
async function fetchData() {

 return "Done!";
}
```
```
